Brake Test Case Study

Challenge

Our client needed a system that could determine the status of the brake and set it depending on that status. The setting of the brake was critical, or it could crash the entire line, resulting in a significant loss of production time.

Solution

TPI was able to design and build a full test and 1 connection system that traveled with the vehicle to ensure the brake status without stopping the line. Additionally, a portable battery solution was developed for backup use.

Results

The TPI test solutions provided 100% protection of the client's line with no slowdowns.
